

DS 5110: Project Presentation

Restaurant Management System

Jyothika Jalla
Sahithi Chigurupati

INTRODUCTION

Our application automates the day-to-day activity of a restaurant. Customers have the convenience of browsing through the restaurant's menu, where they can explore a variety of food options, each accompanied by its respective price. Following this, customers can effortlessly select their desired items from the menu and seamlessly incorporate them into their order. In addition to placing orders, customers are provided with the option to reserve tables at the restaurant or enlist themselves in a reservation waiting list, enhancing their overall dining experience.

Meanwhile, the chefs within the establishment have the capability to monitor the current queue of orders. Once a dish is prepared, they can promptly update the order status to signify its readiness for serving.

For those overseeing the restaurant, such as managers, access to pertinent statistics is facilitated. This includes insights into weekly sales performance. This comprehensive system ensures a streamlined and efficient operation within the restaurant, catering to both customer needs and managerial oversight.

Key Features

- **User-Friendly Customer Interface:** Upon successful login, customers gain access to a user-friendly interface that allows them to seamlessly browse through the restaurant's menu. Our system provides detailed information about each food item, including corresponding prices.
- **Effortless Order Placement:** Customers have the flexibility to select items from the menu, adding them to their order effortlessly.
- **Table Reservations and Waiting List:** Customers can reserve tables at the restaurant, ensuring a smooth and organized dining experience. Additionally, for those times when the restaurant is fully booked, our system provides a reservation waiting list, optimizing customer seating arrangements.

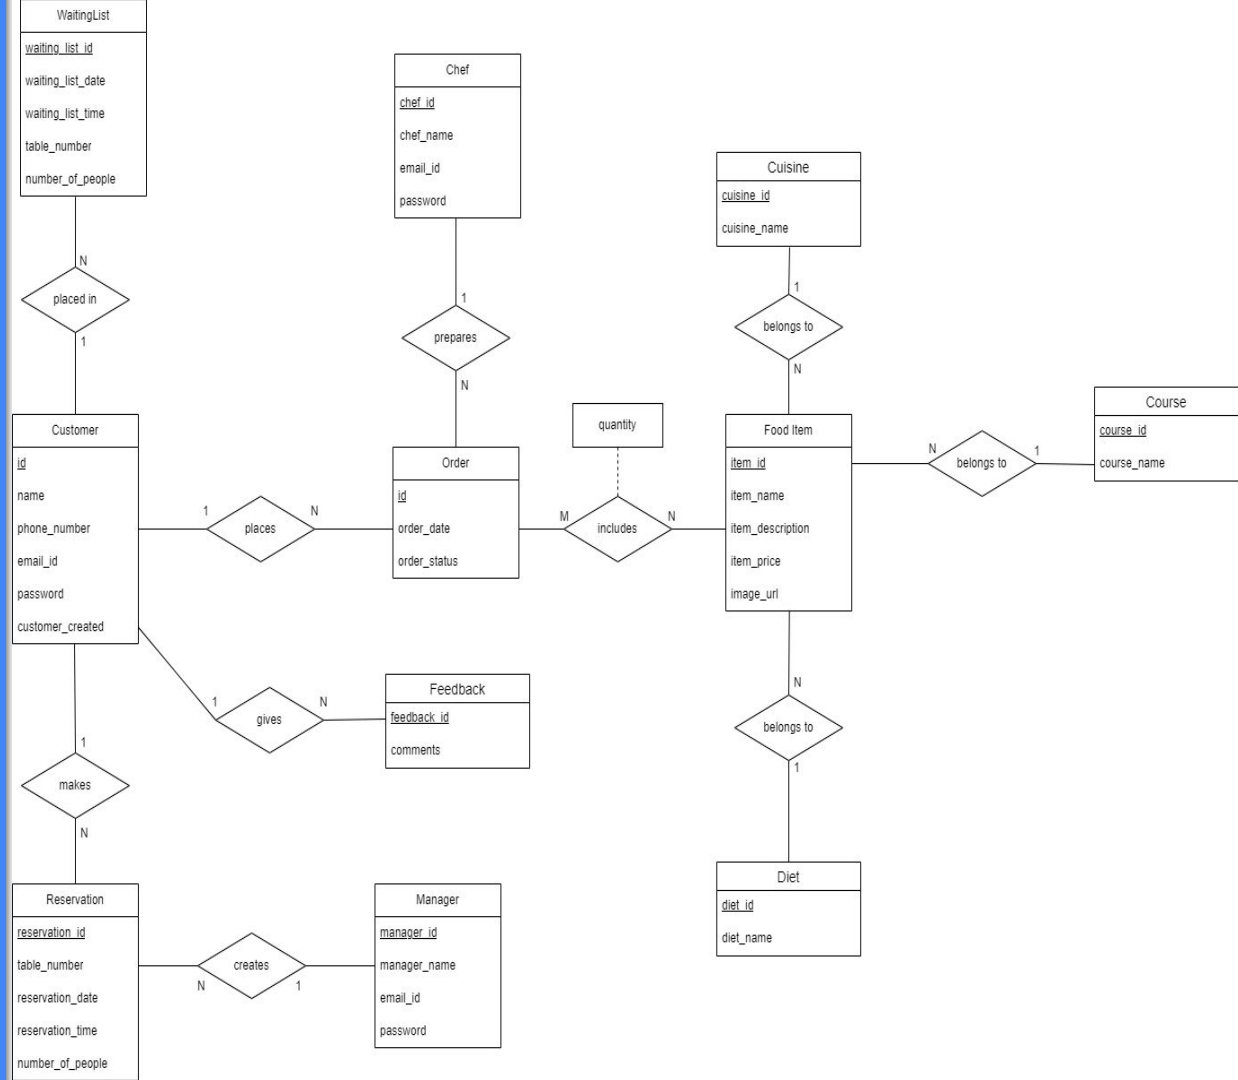

Key Features

- **Order Management for Chefs:** The system empowers chefs to efficiently manage the current queue of orders.
- **Insightful Statistics for Managers:** Restaurant managers gain access to valuable insights through our system. This includes weekly sales reports.
- **Feedback:** Customers are also encouraged to share their experiences through a user-friendly feedback feature. Once a customer has submitted feedback, these reviews are dynamically displayed on the index page for everyone to see before logging in.

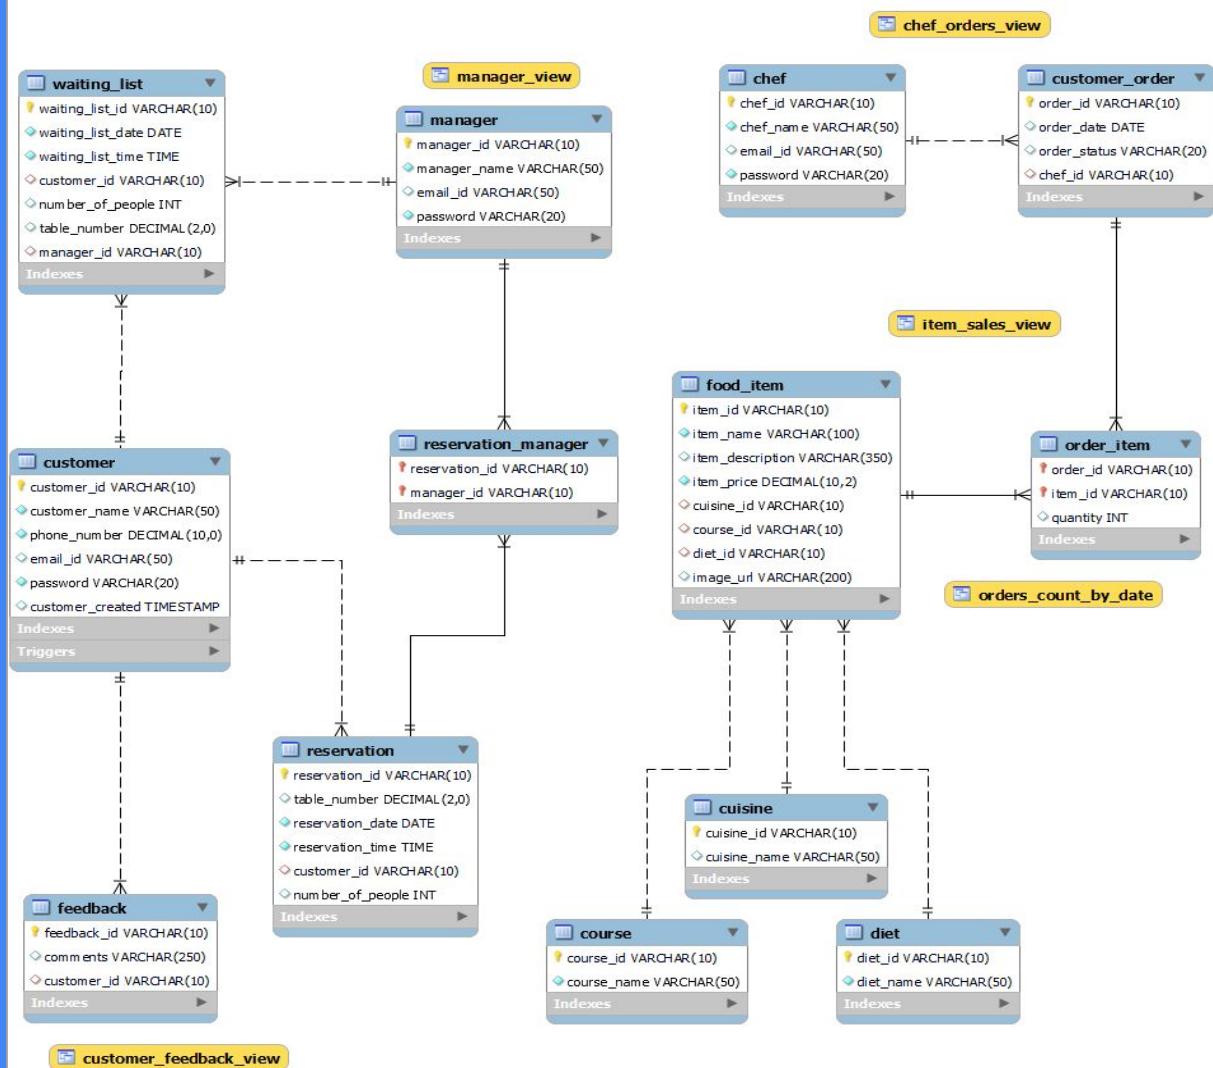

TECHNICAL DESCRIPTION

- Database – MySQL
- Database Application – MySQL Workbench
- Server – Flask
- Host Language – Python
- User Interface – HTML, CSS.
